

## Panel Build Services

SafeTest's panel build service is able to provide panels ranging from small wall mounted equipment to multibay systems.

We can provide full documentation packages using industry standard CAD and 3D ACD drawing systems such as Autocad and Solidworks. Documentation can include as much or as little as the customer requires from basic schematics to mechanical layouts and bills of materials.

Software authoring services are also available for PC based and PLC control.

High quality, readily available, industrial rated components are always used in system construction ensuring that problems and system breakdowns are kept to an absolute minimum.

We have provided quality panel and cabinet build solutions to many industry sectors including medical, automotive and electronics manufacturing.

Many systems have a high level of complexity and rather than expensive and bulky DIN rail relays etc we have the facility for PCB design, layout and manufacture which often reduces the cost, size and build time.

SafeTest draws upon many years experience within the electronics production & test industry – our engineers will be pleased to discuss any build requirement that you may have with a view of achieving a bespoke cost effective solution.
