

## Test Equipment Services

SafeTest's test equipment service is able to provide functional test equipment ranging from low cost basic exerciser test boxes for engineering and diagnostic activities, to fully automated systems for production volume test requirements.

There are numerous generic, high-cost functional systems available in the marketplace, which due to their emphasis on specific market sectors, often provide a heavily compromised test capability.

SafeTest can specify & design test equipment aligned with the technology and function of the customers product such that a more complete level of product test is achieved without the overheads attached to generic test systems.

Wherever possible, specific circuit functions are exercised and verified in an environment that represents the target application. This approach minimises instances where a product under test may pass through a generalised test purely checking for measured values as opposed to exercising a circuit function as it is intended to be used.

SafeTest has provided quality test solutions to many industry sectors including medical, automotive and electronics manufacturing.

High quality, readily available, industrial rated components are always used in test system construction ensuring that, in the unlikely event of a system problem, production test downtime is kept to an absolute minimum.

SafeTest draws upon many years experience within the electronics production & test industry – our engineers will be pleased to discuss any test requirement that you may have with a view of achieving a bespoke cost effective solution.
